If you're familiar with PhotoShop, then you already know how to use Photoshop Elements. If you're still new to Photoshop Elements, then this guide will teach you everything you need to know about editing images. This video explains Photoshop Elements in a step-by-step manner, explaining and demo-ing each function: 1. The main screen The Photoshop Elements main screen has four tabs at the bottom: Edit, Adjust, Skew and Panel. You can find out more about them in the next section. In the Edit tab, Photoshop Elements presents you with basic tools to work with your photos. You can use the Edit tab to open, manipulate and save your files. You can perform adjustments, crop your images and improve the colors. The Adjust tab provides different tools to tweak the color, contrast and brightness of your photos. You can try to look for the perfect color

match by yourself with the Color Match feature. Skew allows you to adjust the orientation of your images. It can be useful when you need to rotate your image vertically or horizontally for the perfect fit on your site or email. The Panel tab contains most of the features that are used to create memes and funny graphics. It allows you to create text, the border and effects and apply them to your images.

2. Open your image The first thing you need to do in Photoshop Elements is to open your image. It's super easy to do. Simply highlight the image and press the Open button on the main screen. This opens the image in the Canvas window, which is located on the upper-left corner of the main screen.

3. Lasso tool The Lasso tool is the main tool for selecting your images. You can use it to select areas of your images that you want to move, change or remove. It's easy to use this tool. Just click anywhere on the image and drag to draw a box around the areas that you want to change. The Photoshop Elements tool will follow your mouse movements. You can choose a color for the selection to highlight it. You can also choose the shape to round off the edges of your selection. To remove unwanted areas, just press Delete on the keyboard and select the area that you want to remove. You can use the Bezier or Rectangle tools to manually select an area or to modify the shape of a selection.

Q: Laravel 4: Differences between create(), save() and ::save() I am using Laravel 4 with DataMapper. I'm seeing some differences between Laravel's data mapper functions on MySQL. If I have an object called "Post" class Post extends DataMapper { static \$table = "posts"; static \$primaryKey = 'id'; public \$increments = false; public \$timestamps = false; } What is the difference between the three approaches of saving this object. Let's say I have a method called "create" in my controller that returns a response, like this //PostsController public function create() { \$post = new Post; \$post->title = 'New Post Title'; \$post->body = 'New Post Body'; \$post->save(); return \$post; } If I use the following approach, I don't have to manually call save() within the method itself. If I use this approach, I don't have to call \$post->save(); //PostsController public function create() { \$post = new Post; \$post->title = 'New Post Title'; \$post->body = 'New Post Body'; return \$post; } Lastly, if I use the following approach, I only have to call \$post->save() once, then I am able to get autoincrements by using MySQL. //PostsController public function create() { \$post = new Post; \$post->title = 'New Post Title'; \$post->body = 'New Post Body'; return \$post; } I know there is a big difference between the three approaches, but I need to understand what those differences are so that I can choose the best one for my situation. A: The first approach is the naive one. It stores the data, then tries to insert it to database. If it fails, it just throws an exception. It's the fastest one, but it's a non-intelligent one, so it has some problems
